

Automation of Weather-Based Sales and Staffing Decisions

Valrie morrison

Problem

Retail kiosk managers make daily decisions without real-time insights.

They must guess:

- What products to promote
- How to staff the day
- How weather impacts customer behavior
- This leads to missed sales opportunities and inefficient staffing.

Solution

I built an automated system that combines weather data and AI to generate a daily action plan.

Every morning the system:

- Pulls real-time weather data,
- Uses AI to generate recommendations, promotion, staffing, and product.
- Sends a clear daily plan via email to the manager each morning.
- Eliminates manual decision making and improves operational efficiency.

The screenshot displays the Zapier web application interface. On the left, a vertical sidebar contains icons for home, search, recent zaps, templates, integrations, and a bottom navigation bar with a plus icon and icons for library, zap, trigger, and search. The main workspace shows a workflow with four steps connected by a vertical line with plus signs:

- 1. Schedule by Zapier** (Trigger): Set to "Every Day".
- 2. GET** (Webhooks by Zapier): Triggered by the first step.
- 3. Send Prompt** (Google AI Studio (Gemini)): Triggered by the second step.
- 4. Send Email** (Gmail): Triggered by the third step.

On the right, a detailed view of the "4. Send Email" step is shown. It includes tabs for "Setup", "Configure", and "Test". The "Configure" tab is active, showing the email body content:

Good morning, Emily 🌞
 Here's today's snapshot for Bayside Brews & Scoops.

Weather: 2. Main Temp: 79.34 °F — 2. Weather Description: broken clouds .

3. Candidates Content Parts Text: <p>1. Produc...oops today!</p>

Generated automatically at 7 AM with weather + AI insights.

At the bottom of the configuration panel is a "Continue" button. The top of the interface shows the user's profile (valrie morriso...), the current zap name (Untitled Zap), and the status (Draft). The top right corner displays the zoom level (83%) and a help link.

OpenWeather API

The screenshot shows a web browser window with the URL `https://api.openweathermap.org/data/2.5/weather?q=Miami,FL,US&units=imperial&appid=3d004bf2c1697c979200661731b155d5`. The browser's developer tools are open, displaying the JSON response from the API. The response is a JSON object containing weather data for Miami, FL, US.

```
{"coord":{"lon":-80.1937,"lat":25.7743},"weather":[{"id":804,"main":"Clouds","description":"overcast clouds","icon":"04d"}],"base":"stations","main":{"temp":79.79,"feels_like":79.79,"temp_min":78.01,"temp_max":82.02,"pressure":1019,"humidity":76,"sea_level":1019,"grnd_level":1019,"visibility":10000,"wind":{"speed":18.41,"deg":100},"clouds":{"all":100},"dt":1775161358,"sys":{"type":2,"id":2009435,"country":"US","sunrise":1775128248,"sunset":1775173051,"timezone":-14400,"id":4164138,"name":"Miami","cod":200}}
```

The JSON response contains the following data:

- `coord`: {"lon": -80.1937, "lat": 25.7743}
- `weather`: [{"id": 804, "main": "Clouds", "description": "overcast clouds", "icon": "04d"}]
- `base`: "stations"
- `main`: {"temp": 79.79, "feels_like": 79.79, "temp_min": 78.01, "temp_max": 82.02, "pressure": 1019, "humidity": 76, "sea_level": 1019, "grnd_level": 1019, "visibility": 10000, "wind": {"speed": 18.41, "deg": 100}, "clouds": {"all": 100}, "dt": 1775161358, "sys": {"type": 2, "id": 2009435, "country": "US", "sunrise": 1775128248, "sunset": 1775173051, "timezone": -14400, "id": 4164138, "name": "Miami", "cod": 200}}

Benefits

The automation helps the business save time, make smarter decisions, and increase sales all without adding extra work.

Challenges & improvements

The biggest challenge was making sure the data flowed correctly between each step, especially getting real weather data into the AI. Once that was fixed, everything worked smoothly. If i had more time, I would improve the formatting and connect it to real sales data for even smarter recommendations.
